

Run on Google Colab

View on Github

The notebook uses three methods to extract the center and other relevant info about the drop in the image. These methods are:

1. Cropping Image Dynamically
2. Subtracting all the Images from a Reference Image
3. Fitting an Ellipse

We have also made some preliminary analysis for all the three methods.

All the code can be found on github repository, specifically on the folder: [codes](#)

Codes still need refactoring!

Imports

```
In [ ]: import matplotlib.pyplot as plt
from misc_tools import Plotter, Smoother
from run import Run
plt.rcParams()
```

```
In [ ]: # Image Directory
IMAGE_DIRECTORY = "../data/images1"
DATA_DIRECTORY = "../data/results"
r = Run(IMAGE_DIRECTORY, DATA_DIRECTORY)
```

Using Dynamic Cropping

```
In [ ]: # Strating Crop coordinates
crop_1 = (150, 40, 40, 40)
crop_2 = (120, 250, 50, 50)
crop_3 = (250, 230, 40, 40)

# Image Positions
positions_1 = (0, 70)
positions_2 = (75, 100)
positions_3 = (106, 155)

df_dc = r.dynamic_cropping(
    crop_1,
    crop_2,
    crop_3,
    positions_1,
    positions_2,
    positions_3,
    save=True, #Saving the generated DataFrame
    file_name="dc",
    plot=False, #whether to plot
    strict=True, #Using the equation of line
    crop_included=False, #Excluding the crop coordinates
)
```

```
Starting dynamic cropping...
First step...
Second step...
Third step...
Saving to csv...
Done!
```

Getting some Samples

```
In [ ]: p = Plotter(df= df_dc, save_path = DATA_DIRECTORY)
```

```
In [ ]: p.get_samples(len_samples = 25,
file_name="using_dc", title="Using DC")
```

Using DC

Preliminary Analysis

```
In [ ]: #Smoothing the data
s = Smoother(df=df_dc)
df_dc = s.smoothen()
df_dc
```

Out[]:
